Notes and Further Reading

Why knowledge graphs?

- Humans:

- Combat information overload
- Explore via intuitive structure
- Tool for supporting knowledge-driven tasks

- AIs:

- Key ingredient for many AI tasks
- Bridge from data to human semantics
- Use decades of work on graph analysis

[Introduction](#)[Review](#)[Anatomy of a URI](#)[Back to the bookstore example](#)[RDF Schema](#)[Introduction](#)[Class and Instance](#)[Label & Comment](#)[Subclass](#)[Property](#)[RDFS Utility Vocabulary](#)[Summary](#)[Vocabularies](#)[Introduction](#)[FOAF](#)[Dublin Core](#)[SKOS](#)[Summary](#)[Example: schema.org](#)[Notes and Further Reading](#)

RDF triples (cont.)

- ▶ An RDF Triple (*s,p,o*) is such that:
 - “*s*”, “*p*” are URI-s, ie, resources on the Web; “*o*” is a URI or a literal
 - “*s*”, “*p*”, and “*o*” stand for “subject”, “property”, and “object”
 - here is the complete triple:

```
(<http://...isbn...6682>, <http://.../original>, <http://...isbn...409X>)
```

- ▶ RDF is a general model for such triples (with machine readable formats like RDF/XML, Turtle, N3, RDFa, Json, ...)

Notes and Further Reading

- A URI uniquely identifies a resource (e.g., person, book, class of things) on the Web
- URI is not always the same as a URL (Uniform Resource Locator)
 - For example,
`http://www.concordia.ca/comp474/lecture03/slides5`
is a valid URI, but not a URL
- URIs have a generic syntax:

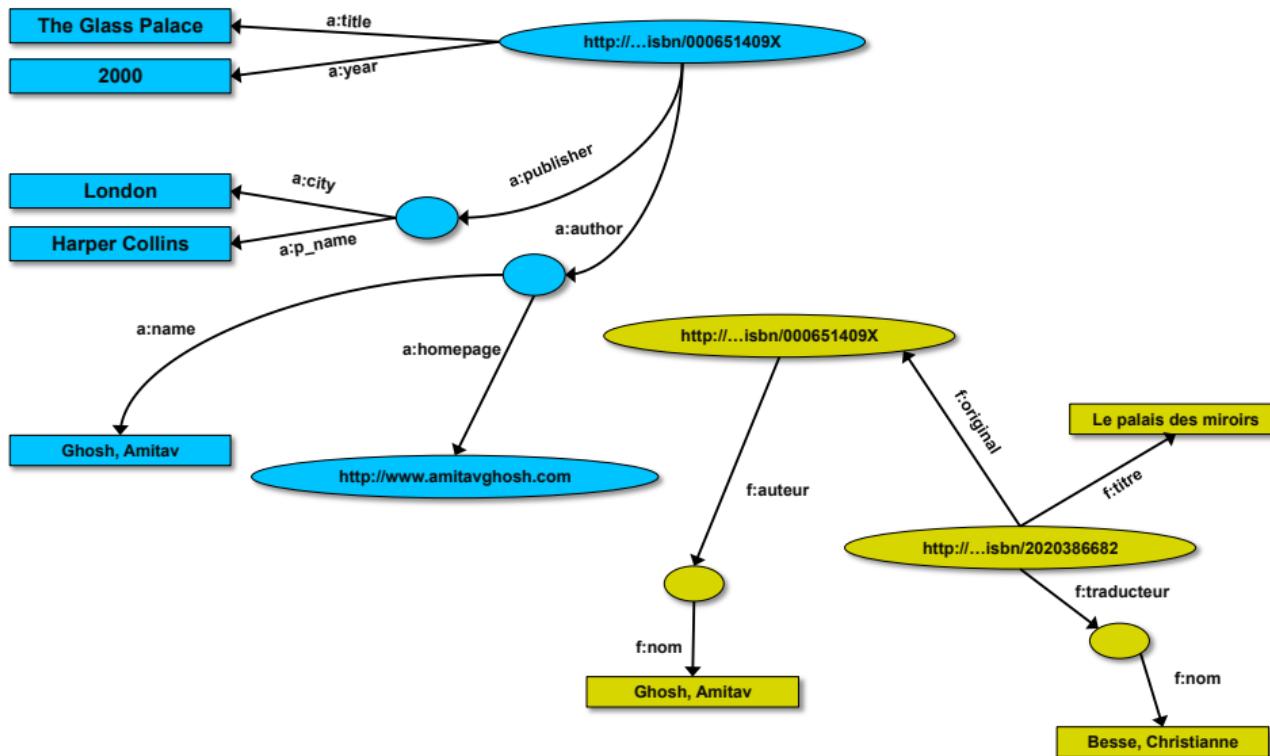

- Queries are also possible:

scheme : [//authority]path[?query][#fragment]

- Namespaces are used to shorten URIs and prevent name clashes, e.g., `ex:me`
- IRIs ('Internationalized Resource Identifier') are URIs with Unicode characters

Notes and Further Reading

From the first week's lecture...

René Witte

Common Issue

- Data in **Information Silos**
Documents, databases,
spreadsheets, emails, ...
- Disconnected, missing knowledge

Knowledge Integration

- Connect silo-ed knowledge
- Leverage existing, external
Knowledge Bases
- Freely available, many domains
- Continuously updated

[Notes and Further Reading](#)

W3C Recommendation

- “RDF Vocabulary Description Language 1.0: RDF Schema” (RDFS 1.0)
- Current version (2014): “RDF Schema 1.1”

Used together with RDF

- RDF provides “a way to make statements about resources” (IRIs)
- RDFS provides *semantics* about what the IRIs stand for
(Schemas aka Vocabularies aka Ontologies aka...)

[Introduction](#)[Review](#)[Anatomy of a URI](#)[Back to the bookstore example](#)[RDF Schema](#)[Introduction](#)[Class and Instance](#)[Label & Comment](#)[Subclass](#)[Property](#)[RDFS Utility Vocabulary](#)[Summary](#)[Vocabularies](#)[Introduction](#)[FOAF](#)[Dublin Core](#)[SKOS](#)[Summary](#)[Example: schema.org](#)[Notes and Further Reading](#)

Classes

- Resources may be divided into groups called **classes**
- The members of a class are known as **instances** of the class
- An instance can be member of **more than one class**

What is a knowledge graph – Pokémon edition: <https://pieterheyvaert.com/blog/2019/12/27/kg-pkmn/>

Defining Classes

We define that an IRI in a triple is a class using ... a triple!
(sounds weird the first time you hear it, but you get used to it)

Notes and Further Reading

Defining Classes

To define that **C** (a resource) is an RDFS `class`, write:

C `rdf:type rdfs:Class`

with `rdfs` defined as <http://www.w3.org/2000/01/rdf-schema#>

Example

`ex:Novel rdf:type rdfs:Class`

Turtle

In Turtle, `rdf:type` can be abbreviated as `a`

→ Worksheet #2: Task 2

[Vocabularies](#)

[Introduction](#)

[FOAF](#)

[Dublin Core](#)

[SKOS](#)

[Summary](#)

[Example: schema.org](#)

[Notes and Further Reading](#)

Instances

To define that **I** (a resource) is an instance of **C** (a class), write:

I `rdf:type C`

(or `a` instead of `rdf:type` in Turtle.)

Example

`<http://...isbn/000651409X> rdf:type ex:Novel`

Note

This is just another triple...

[Introduction](#)

[FOAF](#)

[Dublin Core](#)

[SKOS](#)

[Summary](#)

[Example: schema.org](#)

[Notes and Further Reading](#)

Human-Readable Content

By convention, always provide:

`rdfs:label` a human-readable label

`rdfs:comment` a short (one paragraph) description
using language tags for multiple languages.

Examples (`dbpedia:The_Glass_Palace`)

```
<http://dbpedia.org/resource/The_Glass_Palace>
    rdfs:label      "The Glass Palace"@en ,
                    "Le Palais des miroirs"@fr ;
    rdfs:comment   "The Glass Palace is a 2000 historical novel..."@en ,
                    "Le Palais des miroirs est un roman..."@fr ;
```

[Dublin Core](#)

[SKOS](#)

[Summary](#)

[Example: schema.org](#)

[Notes and Further Reading](#)

Defining a subclass

To define that **C1** (a class) is a **subclass** of **C2** (a class), write:

C1 *rdfs:subClassOf* **C2**

Semantics

This states that all the instances of C1 are also instances of C2.

The *rdfs:subClassOf* property is **transitive**.

SKOS

Summary

Example: schema.org

Notes and Further Reading

Inference: let us be formal...

- ▶ The RDF Semantics document has a list of (33) entailment rules:
 - “if such and such triples are in the graph, add this and this”
 - do that recursively until the graph does not change
- ▶ The relevant rule for our example:

```
If:  
  uuu rdfs:subClassOf xxx .  
  vvv rdf:type uuu .  
Then add:  
  vvv rdf:type xxx .
```

[Introduction](#)[Review](#)[Anatomy of a URI](#)[Back to the bookstore example](#)[RDF Schema](#)[Introduction](#)[Class and Instance](#)[Label & Comment](#)[Subclass](#)[Property](#)[RDFS Utility Vocabulary](#)[Summary](#)[Vocabularies](#)[Introduction](#)[FOAF](#)[Dublin Core](#)[SKOS](#)[Summary](#)[Example: schema.org](#)[Notes and Further Reading](#)

Defining a Property

To define that **P** (a resource) is a **property**, write:

P *rdf:type rdf:Property*

Properties are used to define **relations** between subject resources and object resources.

Example

<is a friend of> <type> <Property>

→ Worksheet #2: Task 7

[SKOS](#)

[Summary](#)

[Example: schema.org](#)

[Notes and Further Reading](#)

Domain

To define a class **C** as the [domain](#) of a property **P**, write:

P [*rdfs:domain*](#) **C**

This states that values of a property are instances of one (or more) class(es).

Range

To define a class **C** as the [range](#) of a property **P**, write:

P [*rdfs:range*](#) **C**

This states that any resource that has a given property is an instance of one (or more) class(es).

Note

- Properties are also resources (named with URIs)
- So we define properties of properties using... RDF properties!
- Again, you'll get used to it...

Property specification serialized

► In RDF/XML:

```
<rdf:Property rdf:ID="title">
  <rdfs:domain rdf:resource="#Fiction"/>
  <rdfs:range rdf:resource="http://...#Literal"/>
</rdf:Property>
```

► In Turtle:

```
:title
  rdf:type    rdf:Property;
  rdfs:domain :Fiction;
  rdfs:range  rdfs:Literal.
```

[Introduction](#)[Review](#)[Anatomy of a URI](#)[Back to the bookstore example](#)[RDF Schema](#)[Introduction](#)[Class and Instance](#)[Label & Comment](#)[Subclass](#)[Property](#)[RDFS Utility Vocabulary](#)[Summary](#)[Vocabularies](#)[Introduction](#)[FOAF](#)[Dublin Core](#)[SKOS](#)[Summary](#)[Example: schema.org](#)[Notes and Further Reading](#)

Defining a Subproperty

To define that **P1** (a property) is a **subproperty** of **P2** (a property), write:

P1 rdfs:subPropertyOf P2

With a subproperty, we can state that all resources related by one property are also related by another.

Example

Like inheritance for classes, we can have inheritance for properties:

<is father of> <subPropertyOf> <is parent of>

Some “helper” constructs

rdfs:seeAlso a property that links a resource to another for more information (can be in any format)

rdfs:isDefinedBy a property typically used to refer to a vocabulary (RDF Schema) defining the subject IRI

There are also some datastructures (bag, list etc.) – read more before using!

Goal: Knowledge Integration

Two major principles:

① Reuse of vocabularies

E.g., always use FOAF to describe names, emails, etc., instead of making up your own schema

② Make your data self-describing

Provide useful information about new terms

For example, if we create our own proprietary term, like **SmallMediumEnterprise**, we could describe it as [HB11]:

```
1 @prefix rdf: <http://www.w3.org/1999/02/22-rdf-syntax-ns#> .  
2 @prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#> .  
3 @prefix owl: <http://www.w3.org/2002/07/owl#> .  
4 @prefix co: <http://biglynx.co.uk/vocab/sme#> .  
5  
6 <http://biglynx.co.uk/vocab/sme#SmallMediumEnterprise>  
7   rdfs:type rdfs:Class ;  
8   rdfs:label "Small or Medium-sized Enterprise" ;  
9   rdfs:subClassOf <http://dbpedia.org/ontology/Company> .  
10  rdfs:subClassOf <http://umbel.org/umbel/sc/Business> ;  
11  rdfs:subClassOf <http://sw.opencyc.org/concept/Mx4rvVjQNpwpEbGdrcN5Y29ycA> ;  
12  rdfs:subClassOf <http://rdf.freebase.com/ns/m/0qb7t> .
```

Reuse vocabularies whenever possible

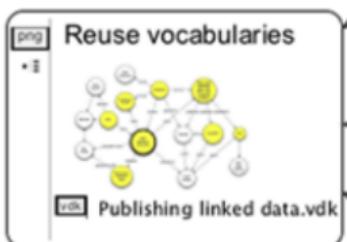

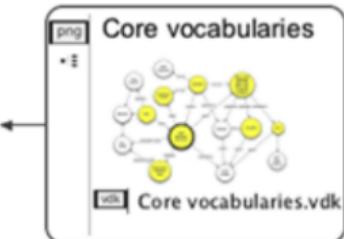

René Witte

Use well-known and authoritative vocabularies to describe things whenever possible.

Describe common types of data by using terms from core vocabularies.

Use authoritative vocabularies for terms not defined by the core vocabularies.

Create your own vocabulary if necessary.

Use RDFS and OWL.

Be prepared to maintain it.

Core Vocabularies

René Witte

Use terms from these core vocabularies to describe commonly understood data.

- ? Naming things? ← Use rdfs:label, foaf:name, skos:prefLabel.
- ? Describing people? ← Use FOAF, vCard.
- ? Describing addresses? ← Use vCard.
- ? Describing projects? ← Use Description of a Project (DOAP).
- ? Describing web pages and other publications? ← Use dc:creator and dc:description.
- ? Describing an RDF vocabulary? ← Use a VoID description.
- ? Describing existing taxonomies? ← Use SKOS.

SKOS

René Witte

- ▶ Represent and share classifications, glossaries, thesauri, etc
 - for example:
 - Dewey Decimal Classification, Art and Architecture Thesaurus, ACM classification of keywords and terms...
 - classification/formalization of Web 2.0 type tags
- ▶ Define classes and properties to add those structures to an RDF universe
 - allow for a quick port of this traditional data, combine it with other data

Notes and Further Reading

The screenshot shows a web browser window with the title "Authorities & Vocabularies (Library of Congress): Fiction". The URL in the address bar is <http://id.loc.gov/authorities/sh85048050>. The page header includes links for Netvibes, Feedly, Social, Private, Mailing lists, SW, Python, RDFa It!, Bookmarks, Add Zemanta, bitly, To Mendeley, TinyURL, To Faviki, and Dokuwiki. Below the header are buttons for "LIBRARY OF CONGRESS", "ASK A LIBRARIAN", "DIGITAL COLLECTIONS", and "LIBRARY CATALOGS". The main navigation menu shows "The Library of Congress > Authorities & Vocabularies > Fiction".

The main content area is titled "Authorities & Vocabularies" and displays the "Fiction" term. It includes a "Return" link, a search bar with placeholder "Enter search terms...", and buttons for "Details" and "Visualize".

Fiction

URI: <<http://id.loc.gov/authorities/sh85048050#concept>>

Type: Topical Term

Alternate Labels: Fiction--Philosophy; Metafiction; Novellas (Short novels); Novels; Stories

Broader Terms:

- [Literature](#)
- [Prose literature](#)

Narrower Terms:

- [Adventure stories](#)
- [Allegories](#)
- [Alternative histories \(Fiction\)](#)
- [Bildungsromans](#)
- [Biographical fiction](#)

Notes and Further Reading

The screenshot shows a web browser window with the URL <http://id.loc.gov/authorities/sh85048050>. The page title is "Authorities & Vocabularies (Library of Congress): Fiction". The main content area is titled "Authorities & Vocabularies" and shows the term "Fiction" highlighted with a red oval. Below it, the "URI" is listed as [<http://id.loc.gov/authorities/sh85048050#concept>](http://id.loc.gov/authorities/sh85048050#concept). The "Type" is "Topical Term". "Alternate Labels" include "Fiction--Philosophy; Metafiction; Novellas (Short novels); Novels; Stories". "Broader Terms" include "Literature" and "Prose literature". "Narrower Terms" include "Adventure stories", "Allegories", "Alternative histories (Fiction)", "Bildungsromans", and "Biographical fiction". Navigation links at the top include "LIBRARY OF CONGRESS", "ASK A LIBRARIAN", "DIGITAL COLLECTIONS", and "LIBRARY CATALOGS". A search bar and a "GO" button are also present.

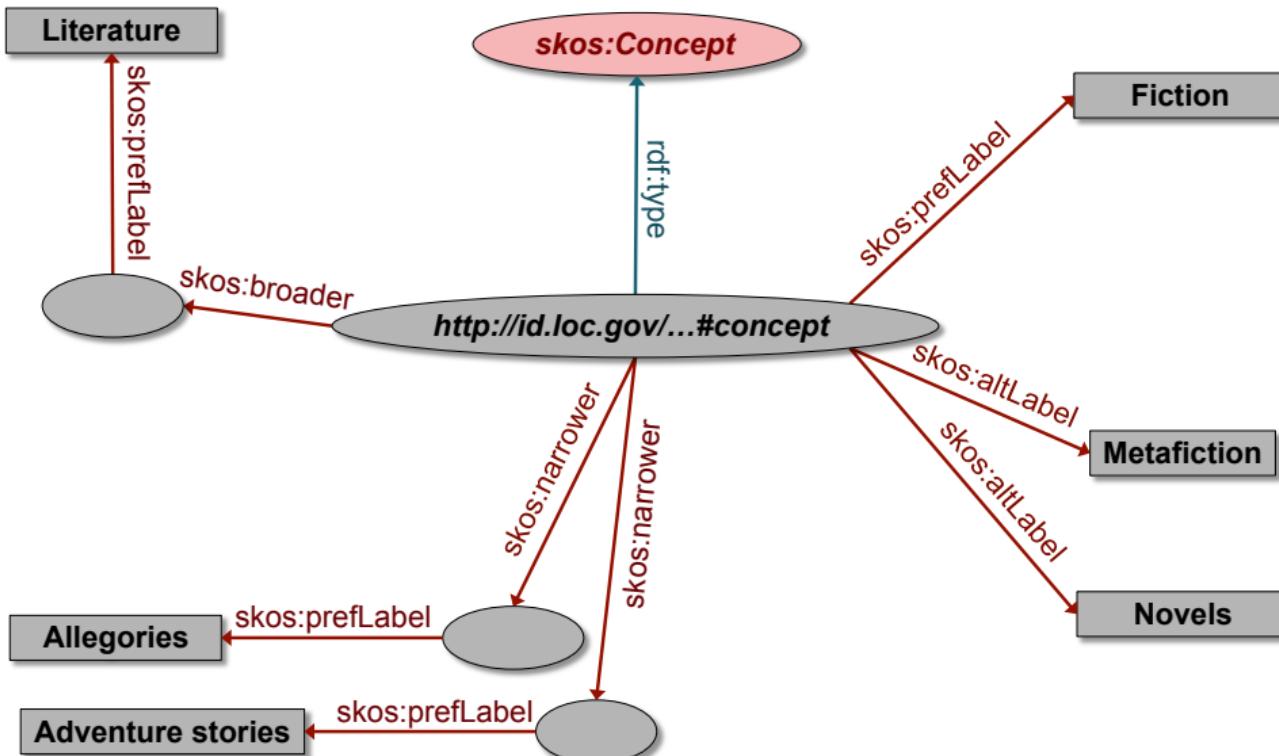

Thesauri have identical structures...

- ▶ The structure of the LOC page is fairly typical
 - label, alternate label, narrower, broader, ...
 - there is even an ISO standard for these
- ▶ SKOS provides a basic structure to create an RDF representation of these

Vocabularies

[Introduction](#)

[FOAF](#)

[Dublin Core](#)

[SKOS](#)

[Summary](#)

[Example: schema.org](#)

[Notes and Further Reading](#)

SKOS terms overview

► Classes and Properties:

- Basic description (Concept, ConceptScheme,...)
- Labeling (prefLabel, altLabel,...)
- Documentation (definition, historyNote,...)
- Semantic relations (broader, narrower, related,...)
- Collections (Collection, OrderedCollection,...)
- Concept mappings (broadMatch, narrowMatch,...)

[Introduction](#)[Review](#)[Anatomy of a URI](#)[Back to the bookstore example](#)[RDF Schema](#)[Introduction](#)[Class and Instance](#)[Label & Comment](#)[Subclass](#)[Property](#)[RDFS Utility Vocabulary](#)[Summary](#)[Vocabularies](#)[Introduction](#)[FOAF](#)[Dublin Core](#)[SKOS](#)[Summary](#)[Example: schema.org](#)[Notes and Further Reading](#)

Importance of SKOS

- ▶ SKOS provides a simple bridge between the “print world” and the (Semantic) Web
- ▶ Thesauri, glossaries, etc, from the library community can be made available
 - LOC is a good example
- ▶ SKOS can also be used to organize, eg, tags, annotate other vocabularies, ...

[Introduction](#)[Review](#)[Anatomy of a URI](#)[Back to the bookstore example](#)[RDF Schema](#)[Introduction](#)[Class and Instance](#)[Label & Comment](#)[Subclass](#)[Property](#)[RDFS Utility Vocabulary](#)[Summary](#)[Vocabularies](#)[Introduction](#)[FOAF](#)[Dublin Core](#)[SKOS](#)[Summary](#)[Example: schema.org](#)[Notes and Further Reading](#)

Importance of SKOS

- ▶ Anybody in the World can refer to common concepts
 - they mean the same for everybody
- ▶ Applications may exploit the relationships among concepts
 - eg, SPARQL queries may be issued on the library data+LOC

[Introduction](#)[Review](#)[Anatomy of a URI](#)[Back to the bookstore example](#)[RDF Schema](#)[Introduction](#)[Class and Instance](#)[Label & Comment](#)[Subclass](#)[Property](#)[RDFS Utility Vocabulary](#)[Summary](#)[Vocabularies](#)[Introduction](#)[FOAF](#)[Dublin Core](#)[SKOS](#)[Summary](#)[Example: schema.org](#)[Notes and Further Reading](#)

More authoritative vocabularies

René Witte

Use these authoritative vocabularies to describe data you couldn't describe with the core vocabularies.
